Sample Questions from the 2013 Paper and Model Answers

Sample Question 1: Explain why ionic compounds conduct electricity when molten

but not when solid. Model Answer: Ionic compounds conduct electricity when molten because the ions are free to move and carry charge. In the solid state, ions are fixed in a lattice and cannot move freely, preventing conduction.

Sample Question 2: Calculate the amount of sodium chloride (NaCl) needed to prepare 250 cm³ of a 0.1 mol/dm³ solution. Model Answer: Molar mass of NaCl = 58.44 g/mol
Concentration = 0.1 mol/dm³ = 0.1 mol/1000 cm³
Moles needed = concentration × volume = 0.1 mol/dm³ × 0.25 dm³ = 0.025 mol
Mass = moles × molar mass = 0.025 mol × 58.44 g/mol = 1.461 g
So, approximately 1.46 grams of NaCl are needed.

Overview of OCR Chemistry B F332 Exam Structure The OCR Chemistry B F332 paper is designed to assess students' understanding of fundamental chemical principles, their ability to apply these concepts to various contexts, and their practical and analytical skills. The exam typically comprises a combination of structured questions, data interpretation, calculations, and extended response questions. Key Components of the F332 Exam: Multiple-choice questions (occasionally integrated within longer questions) Short-answer questions on core topics such as atomic structure, bonding, energetics, kinetics, and organic chemistry Data analysis and interpretation, involving graphs, spectra, and experimental results Extended questions requiring detailed explanations and synthesis of multiple concepts The June 2013 paper exemplifies these elements, emphasizing application and problem-solving over rote memorization. Detailed Breakdown of the June 2013 Questions and Answers Below, we analyze some of the core questions from the June 2013 paper, offering detailed explanations and insights into the correct solutions. Question 1: Atomic Structure and Isotopic Composition Question: A sample of an element contains two isotopes, A and B. The relative atomic masses are 20.00 u and 22.00 u, respectively. The abundance of isotope A is 80%. Calculate the relative atomic mass of the element. Answer: The relative atomic mass (A_r) is calculated using the weighted average:
$$A_r = \left(\text{fraction of A} \times \text{mass of A} \right) + \left(\text{fraction of B} \times \text{mass of B} \right)$$

$$A_r = (0.80 \times 20.00) + (0.20 \times 22.00) = 16.00 + 4.40 = 20.40 \text{ u}$$
 Analysis: This question tests understanding of isotopic abundance and its impact on atomic mass calculations. It underscores the importance of weighted averages in atomic mass determinations, a fundamental

concept underpinning modern atomic theory.

Question 2: Bonding and Structure
Question: Describe the bonding in magnesium oxide (MgO). Explain how the bonding influences its physical properties, such as melting point and solubility.
Answer: Magnesium oxide (MgO) exhibits ionic bonding. Magnesium atoms lose two electrons to form Mg^{2+} ions, while oxygen atoms gain two electrons to form O^{2-} ions. These ions are held together by strong electrostatic attractions, forming an ionic lattice.
Influence on Physical Properties:
High Melting Point: The strong electrostatic forces between Mg^{2+} and O^{2-} ions require substantial energy to break, resulting in a high melting point ($\sim 2800^\circ\text{C}$).
Solubility: MgO is sparingly soluble in water because water molecules can weakly polarize the ions, but the ionic lattice is very stable. Its solubility increases slightly with temperature, typical of ionic solids.
Analysis: Understanding ionic bonding helps predict physical properties. The strong lattice energy correlates with high melting points, while solubility depends on the balance between lattice energy and hydration energy.

Question 3: Energetics and Thermodynamics
Question: Given the following data:
 Enthalpy change of combustion of ethanol, $\Delta H^\circ_{\text{combustion}} = -1367 \text{ kJ/mol}$
 Enthalpy change of formation of ethanol, $\Delta H^\circ_{\text{f}} = -277 \text{ kJ/mol}$
 Calculate the enthalpy change for the reaction:

$$\text{C}_2\text{H}_4(\text{g}) + \frac{3}{2} \text{O}_2(\text{g}) \rightarrow \text{C}_2\text{H}_5\text{OH}(\text{g})$$

Answer: Using Hess's Law:

$$\Delta H = \Delta H_{\text{f, products}} - \Delta H_{\text{f, reactants}}$$
 But since combustion data is given, we use the relation:

$$\text{C}_2\text{H}_4 + \text{O}_2 \rightarrow \text{C}_2\text{H}_4\text{O} \quad \text{(hypothetically, if needed)}$$
 Alternatively, recognizing the given data, a more straightforward approach is to understand that the enthalpy of formation of ethanol is directly provided, so: $\Delta H = -277 \text{ kJ/mol}$
Analysis: This problem involves applying Hess's Law and understanding the relationship between combustion and formation enthalpies. It emphasizes the importance of enthalpy cycle calculations in thermodynamics.

Question 4: Kinetics and Reaction Mechanisms
Question: A reaction between iodine (I_2) and propanone (acetone) in the presence of acid is studied. The rate equation is found to be:

$$\text{Rate} = k[\text{I}_2][\text{Propanone}]$$
 Explain what this rate equation suggests about the reaction mechanism.
Answer: The rate equation indicates that the reaction is first order with respect to both iodine and propanone. This suggests that the rate-determining step involves one molecule of I_2 and one molecule of propanone reacting simultaneously. The mechanism likely involves a bimolecular slow step where both reactants participate together, possibly forming an intermediate.
Implication: The overall reaction mechanism is consistent with a two-molecular step, perhaps involving the formation of an iodine-propanone complex or an electrophilic attack facilitated by acid.
Analysis: Understanding rate laws helps elucidate reaction mechanisms. A rate law showing first-order dependence on each reactant is indicative of a bimolecular slow step, critical in reaction pathway analysis.

Question 5: Organic Chemistry ? Synthesis and Isomerism
Question: Describe two isomers of butene (C_4H_8). Explain their differences in terms of structure and reactivity.
Answer: Isomers of Butene:
1-Butene ($\text{CH}_2=\text{CHCH}_2\text{CH}_3$): Structure: The double bond is between carbon 1 and 2. Features: Terminal alkene, with the double bond at the end of the chain.
2-Butene ($\text{CH}_3\text{CH}=\text{CHCH}_3$): Structure: The double bond is between carbon 2 and 3. Features: Internal alkene, with the double bond within the chain.
Differences in Reactivity: 1-Butene is more reactive in electrophilic addition reactions because the terminal double bond is less

stabilized and more accessible. 2-Butene exists as two stereoisomers (cis- and trans-), which influence physical properties and reactivity. The trans-isomer is generally more stable due to less steric hindrance.

Analysis: Isomerism in alkenes influences their chemical behavior and physical properties. Recognizing structural and stereoisomers is essential in organic synthesis and reactions.
