What Are Spiders?

Spiders are arachnids, a class of joint-legged invertebrate animals that also includes scorpions, ticks, and mites. Unlike insects, which have six legs, spiders have eight legs. They are characterized by their segmented bodies, which consist of two main parts: the cephalothorax (head and thorax combined) and the abdomen.

Common Features of Spiders

Some typical features include:

- Eight legs, often covered in tiny hairs
- Multiple eyes (usually eight) arranged in different patterns

- On plants and trees

The book emphasizes observing spiders in their natural habitats and respecting their space.

How Spiders Spin Webs and Catch Prey

The Science of Silk

Spiders produce silk from specialized glands called spinnerets located at the rear of their bodies. This silk is incredibly strong and stretchy, making it perfect for building webs, lining their nests, or creating egg sacs.

Web-Building Techniques

Different spiders build different kinds of webs:

- Orb webs:** Circular, intricate webs that catch flying insects
- Sheet webs:** Flat, tangled webs close to the ground
- Cobwebs:** Irregular, messy webs often found in corners and sheds

The process involves spinning silk in a strategic way to create sticky, resilient traps for prey.

Hunting Strategies

Not all spiders rely on webs; some are active hunters:

- Jumping spiders pounce on prey
- Wolf spiders chase down insects
- Some spiders wait patiently, using stealth and speed

This diversity in hunting methods highlights the adaptability and ingenuity of spiders.
