Lab 1: Basic Device Connections and Verification

Objective: Connect a PC to a switch, verify physical and data link layer connectivity, and ensure proper configuration.

Steps and Answers:

Physical Connections: Connect the PC's Ethernet port to a switch port using an Ethernet cable.

Verify Cable and Port Status: Use the command `show cdp neighbors` on the switch to identify connected devices.

Configure PC IP Settings: Assign an IP address and subnet mask compatible with the network (e.g., IP: 192.168.1.2, Subnet Mask: 255.255.255.0).

Test Connectivity: Use the ping command from the PC to the switch's VLAN interface or default gateway.

Key Takeaways: Ensure cables are correctly connected and functioning. Verify port status with `show interfaces` and `show cdp neighbors`. Proper IP configuration on the PC is essential for communication.

Lab 2: Configuring Basic Switches and VLANs

Objective: Create VLANs on switches, assign switch ports to VLANs, and verify VLAN segmentation.

Steps and Answers:

Create VLANs: Enter configuration mode and use the command `vlan [VLAN ID]`. For example, `vlan 10` for VLAN 10.

Name VLANs: Use `name VLAN_NAME`, e.g., `name Sales`.

Assign Ports to VLANs: Enter interface configuration mode, e.g., `interface fastethernet 0/1`, then assign with `switchport access vlan 10`.

Verify VLAN Configuration: Use `show vlan brief` to see VLANs and assigned ports.

Key Takeaways: VLAN creation and assignment enhance network segmentation and security. Always verify VLAN status with `show vlan brief`.

Lab 3: Inter-VLAN Routing Using a Router-on-a-Stick

VLANs through subinterfaces, implementing the router-on-a-stick configuration. Steps and Answers

Create Subinterfaces on Router: For each VLAN, create a subinterface, e.g., interface gigabitEthernet 0/0.10 for VLAN 10.

Assign IP Addresses: Assign an IP address to each subinterface within the VLAN's subnet, e.g., ip address 192.168.10.1 255.255.255.0.

Enable Routing: Ensure that routing is enabled; typically, this is enabled by default on Cisco routers.

Configure Switch Ports: Set switch ports connected to hosts as access ports assigned to respective VLANs.

Verify Connectivity: Use ping commands between devices in different VLANs to test inter-VLAN routing.

Key Takeaways

Router-on-a-stick allows inter-VLAN communication without multiple physical interfaces. Proper subinterface configuration and IP addressing are crucial for success.

Lab 4: Basic Network Troubleshooting

Objective Identify and resolve connectivity issues within a simple network topology.

Common Troubleshooting Steps and Answers

Check Physical Connections: Ensure all cables are correctly connected and functioning.

Verify Interface Status: Use show ip interface brief to check if interfaces are up/up.

Confirm VLAN Assignments: Use show vlan brief to verify correct VLAN configurations.

Check IP Addressing: Confirm that devices have appropriate IP addresses and subnet masks.

Test Connectivity: Use ping and traceroute to locate where the connection fails.

Review Security Settings: Ensure no access control lists (ACLs) are blocking traffic.

Key Takeaways

Systematic troubleshooting involves verifying physical, data link, and network layer configurations. Use show commands effectively to diagnose issues.
