Interpret johansen cointegration test evIEWS

Interpret Johansen Cointegration Test EViews: A Comprehensive Guide Understanding the Johansen cointegration test and its interpretation in EViews is essential for economists, financial analysts, and researchers involved in time series analysis. This article provides an in-depth explanation of how to perform the Johansen cointegration test in EViews and interpret its results effectively. Whether you are new to cointegration analysis or seeking to refine your understanding, this guide will walk you through every critical step.

Introduction to Cointegration and the Johansen Test

What is Cointegration? Cointegration is a statistical property of a set of time series variables. When individual series are non-stationary (their statistical properties change over time), they can still be cointegrated if a linear combination of these variables is stationary. This implies a long-term equilibrium relationship among the variables, despite short-term deviations.

Why is Cointegration Important? Identifying cointegration among variables is crucial for:

- Validating economic theories that suggest long-term relationships
- Building accurate predictive models
- Conducting error correction modeling
- Avoiding spurious regression results

The Johansen Cointegration Test

Developed by Søren Johansen in 1988, the Johansen test is a multivariate approach to determine the number of cointegrating relationships among multiple time series variables. Unlike the Engle-Granger method, which is limited to a single cointegrating vector, Johansen's method can detect multiple cointegration vectors simultaneously.

Preparing Data for Johansen Cointegration Test in EViews

Before performing the test, proper data preparation is vital:

- Steps for Data Preparation**
- Ensure Data Stationarity of Differenced Series:** The variables should be non-stationary in levels but stationary in differences.
- Check for Structural Breaks:** Structural breaks can affect test results;

consider tests for breaks if necessary.

Align Data Periods: All series must cover the same time span with consistent frequency.

Transform Data if Needed: Log transformations can stabilize variance, especially for economic data like GDP, prices, or exchange rates.

Performing the Johansen Cointegration Test in EViews

Step-by-Step Guide

Open EViews and Load Data

Import your time series data into EViews. Ensure data is in a workfile with variables arranged in columns.

Check for Stationarity

Use Augmented Dickey-Fuller (ADF) tests to verify that variables are integrated of order one, $I(1)$. Variables should be non-stationary in levels but stationary in first differences.

Select the VAR Model

Choose an appropriate lag length for the VAR model. Use information criteria like Akaike Information Criterion (AIC), Schwarz Bayesian Criterion (SBC), or Hannan-Quinn to determine optimal lag length.

In EViews: Go to `Quick` > `Estimate VAR...` Specify the lag length and variables.

Perform the Johansen Cointegration Test

With the VAR model estimated, go to: `View` > `Cointegration Tests` > `Johansen Cointegration Test` Choose the test type: Trace test Maximum Eigenvalue test Specify the number of lags (based on previous step). Set the deterministic trend assumption (none, constant, or trend) depending on your data.

Review the Output

The results include test statistics for different numbers of cointegrating vectors ($r=0,1,2,\dots$). Critical values are provided for significance testing.

Interpreting Johansen Test Results in EViews

Understanding the Test Statistics

Trace Test Statistic: Tests the null hypothesis that the number of cointegration vectors is less than or equal to r against the alternative of more than r .

Maximum Eigenvalue Statistic: Tests the null hypothesis that the number of cointegration vectors is r against the alternative of $r+1$.

How to Interpret the Results

Check the Test Statistics Against Critical Values

For each hypothesized number of cointegration vectors (r), compare the test statistic to the critical value. If the test statistic exceeds the critical value, reject the null hypothesis.

Determine the Number of Cointegrating Vectors

Starting from $r=0$ (no cointegration), move upward. The highest r for which the null hypothesis is rejected indicates the number of cointegration vectors.

Implications of the Results

$r=0$: No long-term relationship exists.

$r>0$: Long-term equilibrium relationships exist among the variables. The number of vectors influences model specification, such as error correction models.

Practical Example of Johansen Test Interpretation

Suppose you analyze three economic variables: GDP, inflation, and interest rates.

Null Hypothesis	Trace Statistic	Critical Value	Result
$r=0$	45.6	47.1	Fail to reject
$r\geq 1$	20.3	29.7	Reject
$r\geq 2$	5.2	15.4	Fail to reject

Interpretation: The null hypothesis that there are zero cointegration vectors ($r=0$) cannot be rejected. The null that there is at most one cointegration vector ($r\geq 1$) is rejected. Therefore, the data suggests one long-term cointegrating relationship among the variables.

Common Challenges and Tips in Interpreting Johansen Test in EViews

Choosing the Correct Lag Length: Too many lags may reduce power; too few may omit important dynamics.

Deterministic Trend Specification: The choice between none, constant, or trend affects the test outcome.

Sample Size: Small samples can distort test results; larger samples provide more reliable inferences.

Structural Breaks: Ignoring breaks may lead to misleading conclusions; consider tests for breaks and adjust models accordingly.

Multiple Cointegration Vectors: When multiple vectors exist, identifying and interpreting each requires further analysis.

Conclusion

The Johansen cointegration test is a powerful tool for uncovering long-term relationships among multiple time series variables. Properly performing

and interpreting this test in EViews involves understanding the underlying theory, preparing data adequately, selecting appropriate model specifications, and carefully analyzing the results. By following the detailed steps outlined in this guide, researchers and analysts can confidently apply the Johansen cointegration test in EViews, ensuring robust insights into their economic data. Recognizing the number of cointegrating relationships helps in building accurate models, informing policy decisions, and advancing economic research.

Interpreting the Johansen Cointegration Test in EViews: A Comprehensive Guide

Understanding the relationships among multiple time series variables is crucial in econometrics, especially when dealing with non-stationary data. The Johansen cointegration test in EViews provides a robust framework for identifying whether a set of variables share a long-term equilibrium relationship. This guide offers an in-depth look into how to interpret the Johansen cointegration test results within EViews, helping researchers and analysts draw meaningful conclusions from their econometric models.

What Is the Johansen Cointegration Test?

Before diving into interpretation, it's essential to understand what the Johansen cointegration test entails. Developed by Søren Johansen in 1988, this test extends the Engle-Granger methodology to multiple variables, allowing for the detection of multiple cointegrating relationships simultaneously. It is particularly useful in systems involving three or more non-stationary variables, such as GDP, interest rates, and exchange rates.

Key features of the Johansen test include:

- Handling multiple cointegrating vectors
- Utilizing maximum likelihood estimation
- Providing two main test statistics: Trace and Max Eigenvalue tests

Conducting the Johansen Cointegration Test in EViews

The process involves a few key steps:

- Preparing your data:** Ensure your variables are non-stationary in levels but stationary in their differences.
- Unit root testing:** Use Augmented Dickey-Fuller or Phillips-Perron tests to confirm non-stationarity.
- Specifying the VAR model:** Select an appropriate lag length based on criteria like AIC or SBC.
- Running the Johansen test:** In EViews, go to `Quick` > `Estimate VAR`. Specify the lag length. After estimation, select `View` > `Cointegration Test` > `Johansen Cointegration Test`.

Interpreting the output: EViews will generate test statistics and critical values.

Interpreting Johansen Test Results in EViews

Understanding the output from the Johansen cointegration test is pivotal. The results primarily comprise the trace statistic and the maximum eigenvalue statistic, along with their respective critical values. These statistics help determine the number of cointegrating relationships among your variables.

Key Components of EViews Johansen Output

- Eigenvalues (?):** Indicate the strength of the cointegrating relations.
- Trace Statistic:** Tests the null hypothesis of 'r' cointegrating vectors against the alternative of 'more than r'.
- Maximum Eigenvalue Statistic:** Tests the null hypothesis of 'r' cointegrating vectors

against the alternative of 'r+1'.
Step-by-Step Interpretation of Johansen Test Results
Determine the Number of Cointegrating Vectors
The primary goal is to identify the number of cointegrating relationships (denoted as 'r') among your variables.
Procedure: Begin with the null hypothesis that there are r cointegrating vectors.
Review the trace statistic: If the trace statistic exceeds the critical value at a chosen significance level (e.g., 5%), reject the null hypothesis. Proceed to test higher values of r until the null cannot be rejected.
Similarly, analyze the max eigenvalue statistic: It tests the null hypothesis that there are r cointegrating vectors against the alternative of r+1. Follow the same rejection rule based on critical values.
Example: Suppose your EViews output shows:
| Test Statistic | Critical Value (5%) | Decision |
||-----||-----||-----||-----|| Trace r=0 | 50.25 | 47.21 |
Reject null (r=0) || Trace r=1 | 20.15 | 29.68 | Fail to reject null (r?1) || Max Eigen r=0 | 30.10 | 27.07 |
Reject null (r=0) || Max Eigen r=1 | 10.00 | 15.41 | Fail to reject null (r=1) |
Interpretation: Since the trace statistic for r=0 exceeds the critical value, reject null hypothesis of zero cointegrating vectors. For r=1, the trace statistic does not exceed the critical value, so fail to reject the null of one cointegrating vector. Similarly, the max eigenvalue test supports the conclusion of one cointegrating relationship.
Confirm the Number of Cointegrating Relationships
Based on the above, there is likely one cointegrating vector among your variables.
Examine the Cointegration Vector(s)
EViews provides the cointegrating vector coefficients: These coefficients reveal the long-term equilibrium relationships. For example, if you have variables X, Y, and Z, the cointegrating equation might look like: $\hat{Y} = 0.5X + 1.2Z + \text{error term}$
The sign and magnitude of coefficients indicate the nature and strength of relationships.
Note: Always check for economic plausibility when interpreting these vectors.
Additional Tips for Interpreting Johansen Test Results
Check the stability of the cointegrating relationships over different sample periods. Assess the robustness by varying lag lengths and re-running tests.
Combine with economic theory: Cointegration suggests a long-run relationship, but causality may not be established; further analysis like Vector Error Correction Models (VECM) is necessary.
Pay attention to the trace vs. max eigenvalue tests: Both should generally lead to consistent conclusions, but discrepancies can occur.
Practical Considerations and Common Pitfalls
Incorrect lag length: Using too few or too many lags can distort results.
Non-stationary data: Ensure variables are integrated of order one, I(1), before testing.
Structural breaks: Major economic events can affect cointegration; consider tests that accommodate breaks.
Sample size: Small samples can reduce test power; interpret results cautiously.
Summary: How to Interpret Johansen Cointegration Test in EViews
Step 1: Confirm variables are non-stationary in levels but stationary in differences.
Step 2: Select appropriate lag length for the VAR.
Step 3: Run the Johansen cointegration test.
Step 4: Examine the trace and max eigenvalue statistics against critical values.
Step 5: Determine the number of cointegrating vectors based on the rejection of null hypotheses.
Step 6: Analyze the cointegrating vectors for long-term relationships.
Step 7: Use these insights for further modeling, such as VECM analysis.
Final Thoughts
Interpreting the Johansen cointegration test results in EViews is a vital step in understanding the long-term dynamics among multiple economic variables. By systematically analyzing test statistics and coefficients, researchers can uncover meaningful relationships that inform policy-making, investment decisions, and academic research. Remember, statistical

significance should always be complemented with economic intuition for comprehensive analysis. In summary, mastering the interpretation of Johansen cointegration tests in EViews empowers analysts to confidently identify and leverage long-run relationships in their data, providing a solid foundation for advanced econometric modeling and forecasting.
